For Immediate Release Thursday, May 8, 2003:

New York, NY, May 8 - eZmeeting, a leader in web collaboration and conferencing, announced today that it is adding eZ Project File Sharing to its rich set of capabilities. "eZShare will provide great value to corporations and customers who require location-independent, secure and reliable network sharing of documents within a workgroup or enterprise", said Charlie White, CEO of eZmeeting.

eZ Project File Sharing allows for secure and verifiable transfer of files between network members. Files can be shared within user-defined groups or globally, and can be retrieved not only by filename and owner, but also by keyword and category metadata added by the owner at share-time. As such, eZ File Sharing allows effortless distribution of documents within a workgroup, regardless of the location of the workgroup members. In addition, eZshare transparently navigates firewalls without requiring special configuration, thus making it a strong addition to the corporate workgroup toolset.

A strong security model supports eZshare. Handshake security is provided by a PKI infrastructure internal to eZnetwork, thus assuring that file sharing participants are network members and, where appropriate, group members. In addition, all file transfers are analyzed digitally on receipt to verify that the file received is identical to the file originally shared.

eZshare leverages a secure and robust authenticated P2P file sharing network. All transfers are auditable via the eZnetwork Broker interface, including entry points of any modified digital assets.

Sigma Design, the parent company of eZmeeting, was established in 1975. It developed the world's first CAD system for architecture and facilities. In 1996, Sigma was acquired by private investors Mort Olshan and Charlie White. Today, Sigma Design has over 1000 companies using its products.

eZmeeting specializes in developing graphic and real-time networking products. Its 2D and 3D graphics rendering engines are among the most advanced in the industry, while our networking technology provides a secure, managed channel for real-time data sharing, live collaboration, chat, and file transfer solutions over a peer-to-peer network.

The flagship product, eZ (www.ezmeeting.com) is a desktop software application that allows groups of people separated by distance to simultaneously connect with each other to review, share, markup and archive copies of all types of commonly used documents, including PDF, Word, PowerPoint, Excel, JPG, AutoCAD, screen grabs and more.

eZ empowers organizations with world leading software designed to improve personal and team productivity and increase corporate profitability with a better and faster method of visually communicating that is cost effective.
